```
graph TD; A1[align sample: rna_1] --> C1[merge group: lane1]; A2[align sample: rna_2] --> C1; A3[align sample: rna_3] --> C2[merge group: lane2]; C1 --> D1[count sample: lane1]; C2 --> D2[count sample: lane2]; D1 --> E[DGEList]; D2 --> E; E --> F[all];
```

The diagram illustrates a bioinformatics pipeline. It begins with three alignment steps: 'align sample: rna_1', 'align sample: rna_2', and 'align sample: rna_3'. The first two steps feed into a 'merge group: lane1' step, while the third step feeds into a 'merge group: lane2' step. These merge steps then lead to 'count sample: lane1' and 'count sample: lane2' respectively. Both counting steps feed into a central 'DGEList' step. Finally, the 'DGEList' step leads to the 'all' output step.
